

Nested Loops

Python programming language allows the usage of one loop inside another loop. The loops can be nested the same way, the conditional statements are. The general syntax of such an arrangement is:

```
while(Expression1):  
    <Execute this code block till the Expression1 is True>  
    while(Expression2):  
        <Execute this code block till the Expression2 is True>  
        #Increment/Decrement in Looping variable  
        #Increment/Decrement in Looping variable
```

****Keep the indentations in mind**
